

# GENNIUS Patio System

## A Versatile Belt Driven Pleated Patio system

The GENNIUS belt drive Pleated Patio system offers customers a system which is versatile and simple in design.

When fully retracted, the pleats simply fold away to minimize the storage space. A Hood Beam is available as an option to cover the retracted section with fabric, preferably waterproof, which is attached to the Hood Beam and the wall or fixing point. This gives protection to the retracted cross-beams and fabric from rain and debris. The retractable nature of the GENNIUS offers all year round options to provide sun screening in summer, or weather protection during the winter months. The water drains over the front of the awning and can be collected in a gutter, which is another option that is offered, for the GENNIUS.

The pleats of the GENNIUS can be made to suit individual size requirements, offering the best possible solution for all applications. The GENNIUS offers individual pleats of fabric and should any damage occur only the damaged pleat needs to be replaced - a real saving for the future.

The GENNIUS awning offers versatility, with a range of fabric options including acrylic, PVC coated fabrics or screen mesh (just to name a few). Your choice of fabric will ensure the right covering is available to suit your needs. With a wide open space feel to GENNIUS it offers a solution to space utilization of the available area.

Another option available for the GENNIUS is the Side Infill. With the Side Infill this enables the GENNIUS to be enclosed on one or both sides. The Side Infill can have a vertical awning attached and, depending on the fabric used, can provide extra shade and comfort from the elements.

The GENNIUS belt driven pleated patio system is the ideal solution for creating extra useable space, whether this be for restaurants, clubs, hotels, or at home. The GENNIUS system derives much of its functionality from the excellence in engineering with the very clever use of the Carbon Steel reinforced drive belts to move the awning from the fully closed position to being entirely open, or somewhere in between. For optimum performance from this all weather awning, the GENNIUS is motorized with a remote control.

The GENNIUS has a powder-coated aluminium structure and is extruded to ensure maximum strength and durability. The GENNIUS can be manufactured in a wide range of sizes, from widths as little as 3 metres and up to 13.5 metres. The *standard* projection can be as much as 7 metres, but larger projections are available, provided the awning is top fixed. The elegant front posts complete the awning, and where required, offer the optional fitting of clear PVC screens or other fabrics, to enclose the front of the awning. This can be used in conjunction with the Side Infill option.
