

Make warehouse management simple

Use a trusted Warehouse Management System to lower costs, be more efficient and dramatically improve your order management and inventory control - while continuing to work seamlessly with your existing systems.

Why Choose Datapel?

Built to drive business operations with advanced order management and inventory control workflows to achieve best practice for your industry. Gain real-time insights and streamline operations with efficient order fulfilment and automated back order management. Achieve high levels of productivity with real-time transparency into business operations.

Increase your profits

Reduce labour costs and stock shrinkage, and improve accuracy when you streamline your existing warehouse management processes. Watch your profits climb again.

Avoid complex and costly system migration

Enterprise upgrades that require massive IT investments? Not needed. Avoid loss of productivity, extensive data conversion and intensive re-training with software that grows with your company.

Lower your inventory spend

Accurate tracking, guided stock picking and optimised usage of warehouse space all allow your operations to run at maximum efficiency. Cut out the wastage.

Improve communication

Quickly scan and attach electronic documents to orders, items or purchases. Track product details from receiving right through to shipping. Stop waiting for delayed communication.

eCommerce and Omni-Channel integration

Centrally manage orders from Shopify, WooCommerce and other popular platforms. Integrate mobile sales orders without re-keying data or build your own using our standards based API.

Harness complete stock visibility

When your search capabilities are this comprehensive (including support for barcode scanning), you can optimise order fulfilment, keep your customers informed and forecast future purchase decisions with confidence.

Integrate seamlessly with your accounting software

Communicate directly to your accounting software using industry standard API technology. Eliminate the need to re-key inventory data, and maintain consistency between accounting and warehouse systems.

Key Functions

Multiple locations and bins

Manage inventory across your operations and guide workers through the most efficient pick path. Precisely locate articles in multiple bins and locations.

Barcode scan and print

Introduce barcoding at your pace with our best practice scan pick, pack and ship workflows. Flexible options for GS1 standard barcodes.

Order management

Manage hundreds of orders daily. Automatically set your team priorities and organise work loads so you remain in control and have clear insights into all operational activity.

Guided pick, pack and putaway

Dramatically increase your productivity with guided article selection. Reduce search times with real-time location of primary and alternative locations for stock.

Inventory management

Utilise best practice warehouse management principles. Take a full 360 degree view of your operations from an inventory-centric perspective.

Purchasing and receiving

Use order demand to anticipate stock requirements and drive purchase re-ordering from internal or external suppliers to close the loop on a successful supply chain.

Returns management

Ensure returns are received from only bonafide customers and within allowed RMA time windows. Link returned goods with shipped serial or batch numbers to avoid “product switching” for expired or faulty products from other suppliers.

eCommerce and EDI transactions

B2B EDI can extend from single order imports to a coordinated exchange of order acknowledgements and confirmations, with advanced order shipment notifications (ASN).

Document and audit trail

Manage disputes, workflow or process shortcomings by audit trail review that clearly details events and times triggered by users, with order number and item references.

Logistics and freight carrier

Integrate easily with your logistics provider. Avoid re-keying of consignment information and automate your supply chain, from web order to carrier pickup.

BI and reporting

Interactive dashboards provide more than just summarised visual widgets, extending to include click to action options. Make informed business decisions.

Case Studies

Increased order accuracy and efficiency

Using Datapel Cloud.WMS, EHI Australia increased order accuracy and maximised warehouse efficiency. They had outgrown their paper-based system, and despite the business growing rapidly, need a solution that would seamlessly integrate to existing operations with minimal disruption.

Key features used

- » Professional Standalone Edition
- » Paperless order picking, label printing, and scan pack
- » ERP integration
- » Bulk container receiving and putaway
- » High volume order management

What they do

EHI Australia supply market leading quality hardware and industrial products at value for money prices.

Industry

Wholesale and distribution

Summary

EHI Australia outgrew their paper-based picking system, and needed a solution which would improve accuracy and minimise penalty charges due to pick errors. Even during rapid business growth, the new Datapel Cloud.WMS system was implemented quickly and smoothly. Ultimately it increased order accuracy and warehouse efficiency, leaving more money for further operational investments.

» Challenges and issues

EHI Australia relied on a good paper-based picking system using incentives for high performing employees. However, the ever-present need to reduce overall error rates and increasingly strict SLAs with major customers—dictated the need to improve accuracy and minimise penalty charges due to pick errors. With rapid business growth, there was a need to modernise the warehouse management system and scale operations. The system needed to be implemented as soon as possible and integrate with the existing ERP solution, handling EDI order connections. We just didn't expect it to be that much of an improvement... even with our best pickers... and now we can multi-skill our entire staff...

Andrew Arthy

CFO EHI Australia

» Solution and implementation

The Datapel Inventory Controller XE and RF mobility solution was deployed with wireless directed scan picking, increasing order accuracy and maximising warehouse efficiency. The training time for EHI warehouse staff reduced by more than half. Penalties were cut to less than ten percent of previous costs, freeing more money for further operational investments.

[VISIT EHI AUSTRALIA AT WWW.EHI.COM.AU](https://www.ehi.com.au)

The system was extremely cost effective and the Datapel team are very helpful, knowledgeable and were committed to delivering a system that met our requirements.
